Pressure Plate

Light and portable device. The most accurate and cost effective way for balance&pressure assessment and training.

PhysioSensing allows you to evaluate your clinical practice and make it objective and quantified in a clinical report.

Technology
- 1 cm² sensor
- 1600 sensors
- Baropodometric plate

Accessories

Carry Bag

Foam

40 x 40 x 8 cm
18 Kg/m3 density

Compatible Software

Physiosensing Balance Software

Physiosensing Podo Software

sensingfu+ure

Balance evaluation

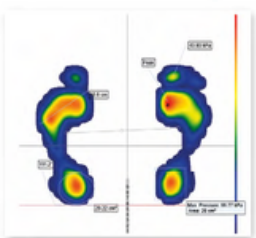

PhysioSensing Range Technology

1. Balance

Balance control consists of controlling the body center of mass over its limits of stability. Clinical balance assessment can help assess fall risk and/or determine the underlying reasons for balance disorders. The benefits of using force plates in balance assessment comes from their ability to measure center of pressure (CoP).

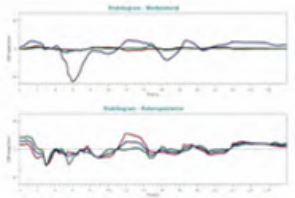

2. Feet Pressure Map

Foot Pressure Mapping is a method of measuring pressures on the surface of the foot during standing or walking. Static and dynamic baropodometricz analysis are performed on a baropodometric platform, through which the pressure exerted by the feet from standstill and during walking is being measured.

3. Posturography

Computerized posturography systems utilize force platforms to measure the sway of a patient by determining the movements of the instantaneous Center of Pressure (CoP). The CoP data collected can be visualized through a statokinesi-gram and stabilogram.

4. Virtual Reality

In the recent decade, Virtual Reality (VR) has become generally accepted as a therapeutic tool for neurological patients. VR involves real-time simulation and interactions between sensory, motor and cognitive channels. VR can be set up to be strongly immersive, in that the environment appears real and three-dimensional. VR provides an ideal environment to study the balancing strategies.

5. Visual Biofeedback

Visual Biofeedback (VB) is a rehabilitation method that can be used during static balance training, offering the patient visual information on the position of the center of gravity within the range of stability as the patient stands on a plate. VB stimulates motivation, proprioceptive information to the patient, simulates the body movements and provides valuable information for the health professional.

physio sensing

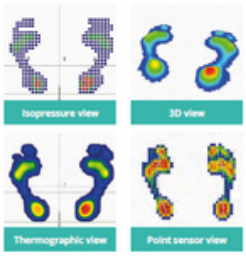

Podo Software

Static and dynamic baropodometric analysis

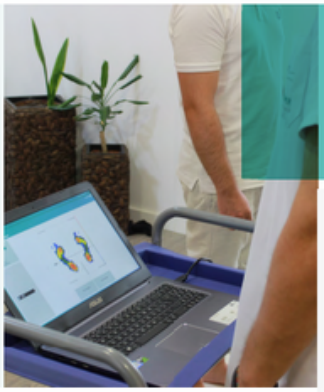

Static & Postural Analysis

Analyze your plantar pressure map distribution in a single (static) image or during a defined time.

- Static mapping with center of pressure
- Max, Average pressure calculations
- Weight distribution
- Measuring possibilities (length, angle, pressure, area)
- Exam comparasion
- Statokinesigram and Stabilogram

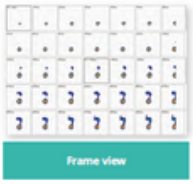

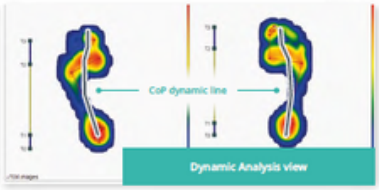

- Frame view
- CPEI
- CoP line
- Force, Area, Pressure, velocity Graphs
- PEAK risk
- Gait Cycle Phases

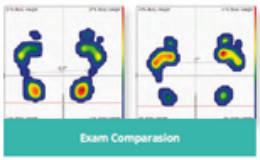

Dynamic Analysis

Analyze your plantar pressure distribution on the platform during a one or four gait cycle

Compatible Plates

General Features

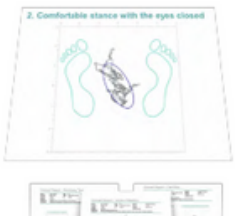

- Clinical Reports with normative Data
- Report
- Patient Management
- Database Export (Excel, PDF)

Balance Software

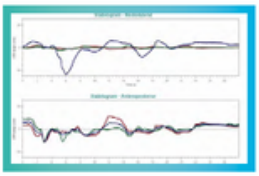

Powerful Balance assessement & training tool

Assessment

mCTSIB- Modified Clinical Test of Sensory Interection on Balance & Romberg Test

This protocol allows the static balance measurement in four sensorial conditions: stable surface and open eyes; stable surface and closed eyes; surface instable and eyes open and surface instable and eyes closed.

Body Sway

Use Body Sway to create a personalized posturography. Define initial conditions and obtain CoP variation, ML and AP variables over time. It also includes more than 30 parameters derived from a posturographic examination including Fourier analyzes.

Limits of Stability LOS

Perhaps the most used protocol for balance assessement. This protocol quantifies the directional control and the maximum distance that the patient can reach with its center of pressure in 8 different directions.

Fall Risk

Use Fall Risk to measure the static balance in four conditions: comfortable stance with eyes open and eyes closed, narrow stance with eyes open and closed. After performing, the value of the sway velocity index appears and provides a fall risk prediction.

Rhythmic Weight Shift

Use the Rhythmic Weight Shift protocol to evaluate the transfer capacity of the center of pressure rhythmically in the sagittal and anteroposterior plane, at three different velocities.

Unilateral Stance

Use this protocol to measure the balance in four conditions: left foot lifted up with eyes open, left foot lifted up with eyes closed, right foot lifted up with eyes open and right foot lifted up with eyes closed.

Balance Error Scoring System

The BESS protocol allows the measurement of postural stability with eyes closed in three different positions on two types of surface (firm and unstable): two feet together, unipodal and tandem position.

Balance improvement training

In the Sagittal and Anteroposterior exercises, the patient must reach the balance position in the sagittal plane or in the anteroposterior plane.

In the Spiderweb, Tunnel, Dots pattern and Bars pattern exercises the goal is to keep a balance position despite the visual stimulus.

In the exercises Route Bars, Route Spiral, Route Square and Route Maze the goal is to go through the routes within its boundaries with the center of pressure, following the red dots.

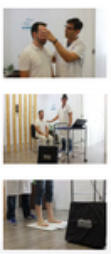

In the exercises Square, Circle, Eight and Spiral, the patient must reach all the dots disposed in the form indicated in the name.

In the Follow the Point and Moving Route exercises, the goal is to reach the moving red point and follow it within its tolerance margin.
